

Software Testing Execution Report

Multi-Platform Functional & UI Validation Analysis

Task 1: Web Navigation Bar Verification (Flipkart) PASS

Objective: Verify that clicking main navigation menu items updates the URL structure correctly and renders expected category pages without errors.

EXECUTION & RESULTS

• Electronics:

- URL Changed To: `https://www.flipkart.com/electronics-store`
- Content Verification: Successfully loaded product carousels for mobiles, laptops, and accessories.

• Fashion:

- URL Changed To: `https://www.flipkart.com/clothing-and-accessories/topwear/pr?sid=clo%2Cash`
- Content Verification: Displayed clothing categories (men's, women's, footwear) and filter sidebars.

• Home & Kitchen:

- URL Changed To: `https://www.flipkart.com/home-kitchen/pr?sid=j9e`
- Content Verification: Rendered home decor, furniture, and kitchen appliance listings.

Summary: All primary menu items dynamically updated the browser URL bar and loaded relevant product grids without breaking page layout or throwing `404 Not Found` errors.

Task 2: Form Field Validation Testing (Zomato / Instagram)

PASS

Objective: Evaluate front-end validation handling for invalid input criteria and empty mandatory fields on the authentication form.

TEST MATRIX & RECORDED ERROR MESSAGES

Scenario / Input	Form Field	Trigger Action	Observed Error Message / Behavior
Blank Required Field	Phone / Email	Clicked <i>Send OTP</i> without typing input.	"Please enter a valid phone number or email address" (Field highlighted red).
Invalid Email Format	Email Field	Entered <code>user@domain</code> (missing <code>.com</code>) or <code>usergmail.com</code> .	"Please enter a valid email address" / Submit button remained disabled.
Incomplete Phone Number	Mobile Field	Entered <code>98765</code> (5 digits instead of 10).	"Phone number must be 10 digits"

Summary: The application effectively intercepted client-side errors prior to backend submission, preventing empty or malformed requests.

Task 3: Windows Desktop Application Testing (Notepad++)

PASS

Objective: Verify setup installer execution, system menu shortcut creation, and local file I/O permissions.

TEST EXECUTION STEPS

1. Ran the official `npp.x64.Installer.exe` executable on Windows 10/11.
2. Completed installation using default wizard configurations.
3. Inspected the Windows Start Menu directory (`C:\ProgramData\Microsoft\Windows\Start Menu\Programs\Notepad++`).
4. Launched Notepad++, typed a sample string (`"Testing Notepad++ File Save Capabilities"`), and saved it to `%USERPROFILE%\Documents\TestNote.txt`.

OBSERVED RESULTS

- **Start Menu Shortcut:** Created successfully under `Start Menu` → `Notepad++`.
- **File Save Verification:** Navigated to `C:\Users\<User>\Documents\TestNote.txt` using File Explorer. The file saved cleanly without administrative permission prompts or file access errors.

Task 4: Mobile App Emulator Testing (Spotify Lite APK)

PASS

Objective: Validate app installation, cold boot execution, and mobile layout component positioning on an Android emulator environment.

SETUP DETAILS

Emulator Environment: Android Studio AVD (*Pixel 6, API 33*) / BlueStacks 5 • **Source File:**

Spotify_Lite.apk

TEST EXECUTION & OBSERVED BEHAVIOR

1. Installed the `.apk` package via drag-and-drop / `adb install`.
2. Launched **Spotify Lite** from the Android home screen drawer.
3. **UI Element Inspection on Login Screen:**
 - **Logo:** Spotify logo rendered centered at the top of the viewport.
 - **Input Fields:** *Email or Username* and *Password* input fields aligned properly with clear hint text.
 - **CTA Buttons:** `LOG IN` and `CONTINUE WITH PHONE NUMBER` buttons remained visible above the soft keyboard.
 - **Responsive Design:** No overlapping text, crushed buttons, or misaligned containers were detected across screen dimensions.

Task 5: Multi-Instance Isolation Testing (Windows Calculator)

PASS

Objective: Verify window management, multi-instance isolation, and state independence in the standard Windows Calculator application.

TEST EXECUTION STEPS

1. Opened the **Windows Calculator** application.
2. Launched a second independent instance (via `Ctrl + N` or Start Menu).
3. Entered calculation `50 * 4 = 200` in **Window A**.
4. Switched focus to **Window B** (via `Alt + Tab` / taskbar click) and performed `100 + 25 = 125`.
5. Toggled back to **Window A** and checked the displayed output and calculation history log.

OBSERVED RESULTS

- **Instance Independence:** **Window A** retained `200` without any state contamination or memory leaks from calculations executed in **Window B**.
- **Memory Function Isolation:** Storing a value into Memory (`MS` button) in Instance A did not affect Memory recall (`MR`) in Instance B.
